# Topics/Goals

- Symbology & Terminology
- Inheritance Patterns

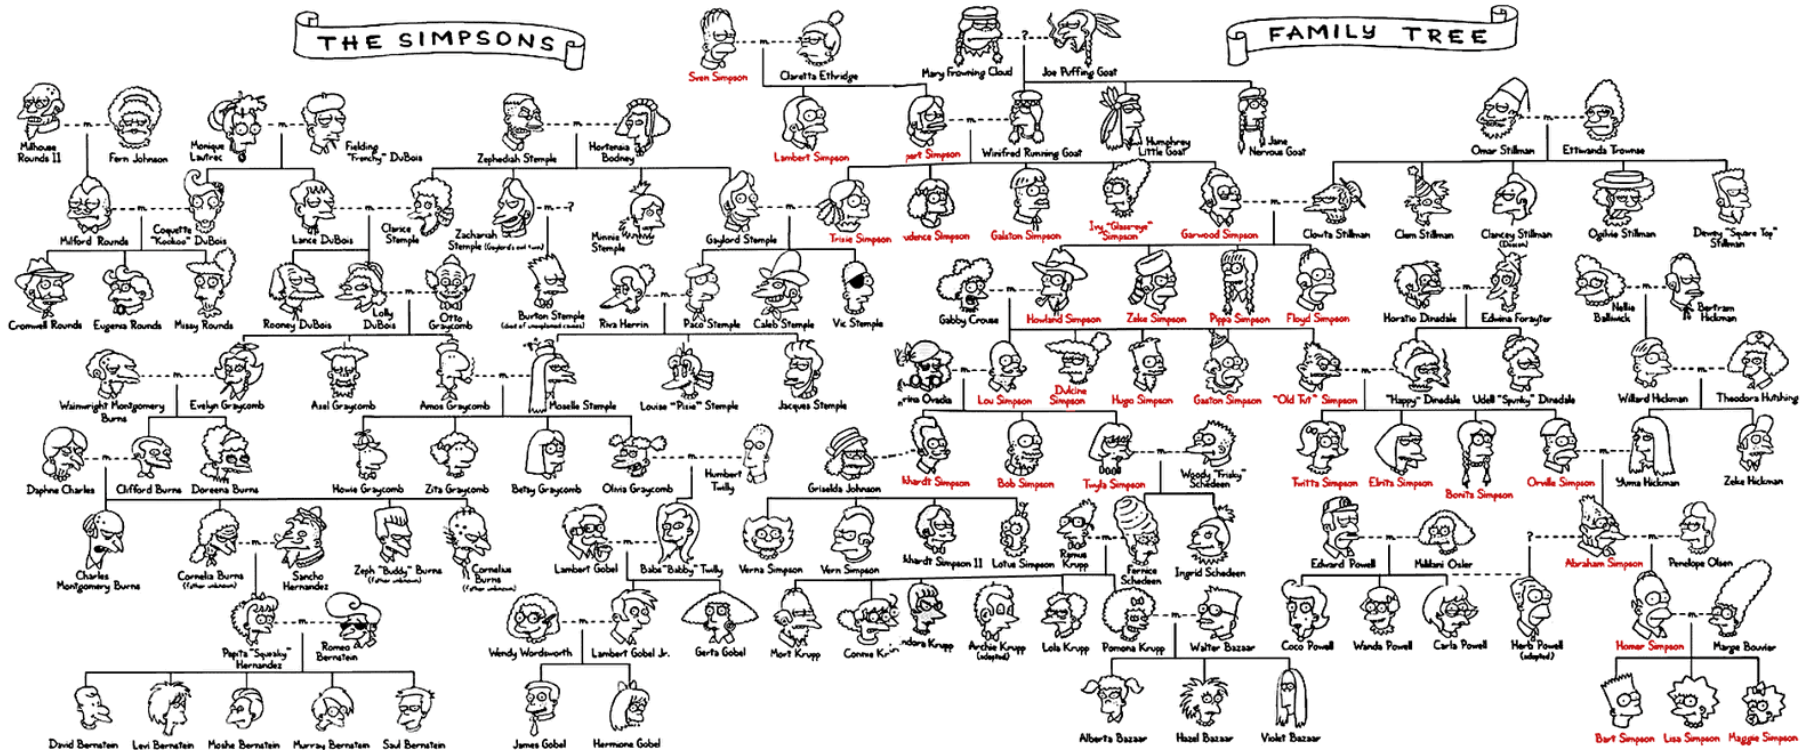

# I. Symbology

Goal: Familiarity with Pedigree Symbols

# Fun With Pedigrees

# Pedigree Terminology

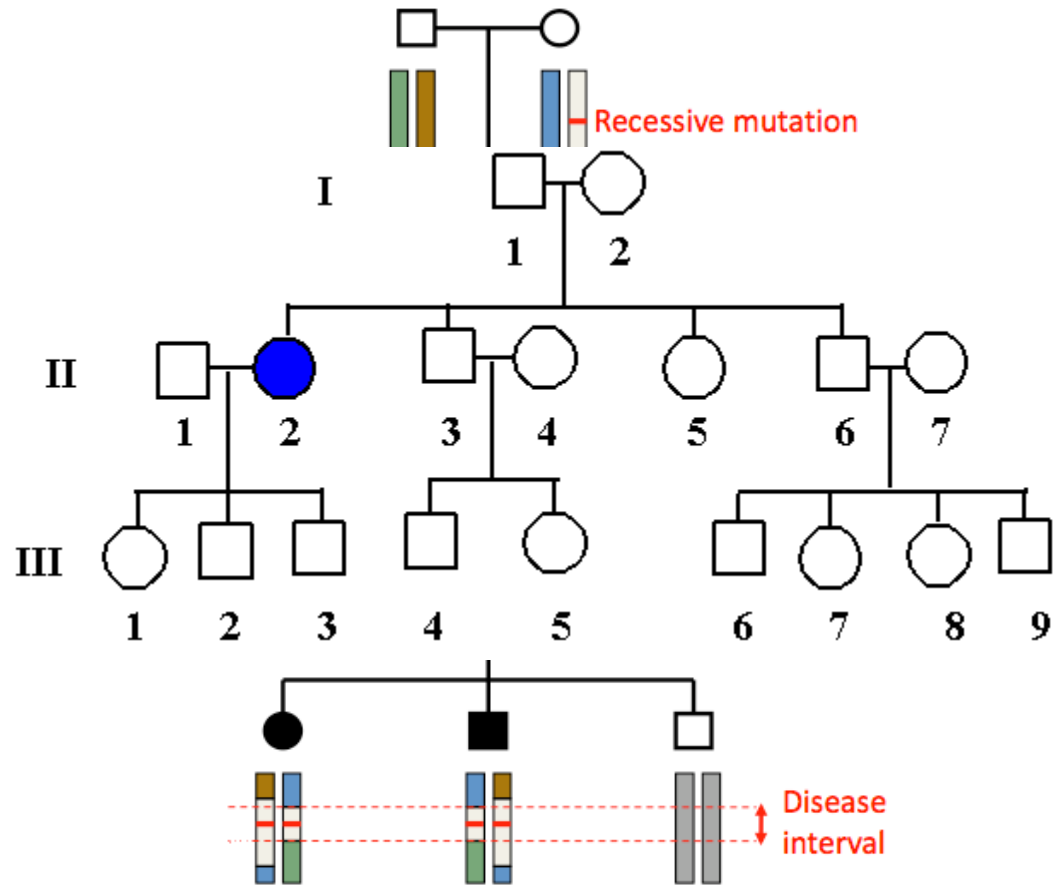

- **Proband/propositus/index case**
- **Consultand** - person who brings the family to medical geneticists' attention
- **Siblings/Sibs** - brothers and sisters
- **Sibship** - all siblings together
- **Kindred** - an entire family

# Pedigree Terminology

- **Consanguineous** - related by descent from a common ancestor
- **Isolated case** - one affected family member
- **Sporadic** - new mutation in the proband

## II. Terminology

### Goal:

Familiarity with basic terminology in **clinical** and **research** genetics

# Basic Tests

A PAIR OF HOMOLOGOUS CHROMOSOMES - ONE DERIVED FROM THE **MALE PARENT**, AND ONE FROM THE **FEMALE PARENT**

**CENTROMERE**,  
CONNECTING  
THE TWO  
CHROMATIDS

**LOCUS**, THE  
POSITION OF A  
GENE ON THE  
CHROMOSOME

ALLELE  
FROM THE  
MALE

ALLELE  
FROM THE  
FEMALE

**ALLELES** ARE DIFFERENT FORMS OF THE GENE FOR A SPECIFIC TRAIT - THEY MAY BE THE SAME, OR DIFFERENT, BUT THEY ARE ALWAYS FOUND AT THE SAME LOCUS ON HOMOLOGOUS CHROMOSOMES

ONE HUMAN BODY CELL CONTAINS 1.8 METERS OF DNA

WITH A FEW TRILLION CELLS, WE HAVE ENOUGH DNA TO REACH TO THE MOON AND BACK OVER 10 TIMES

FOUND IN ALL CELLS

STORES GENETIC INFORMATION

SHAPE IS A DOUBLE HELIX

DEOXYRIBOSE IS A 5-CARBON SUGAR

COMPOSED OF NITROGEN BASE PAIRS

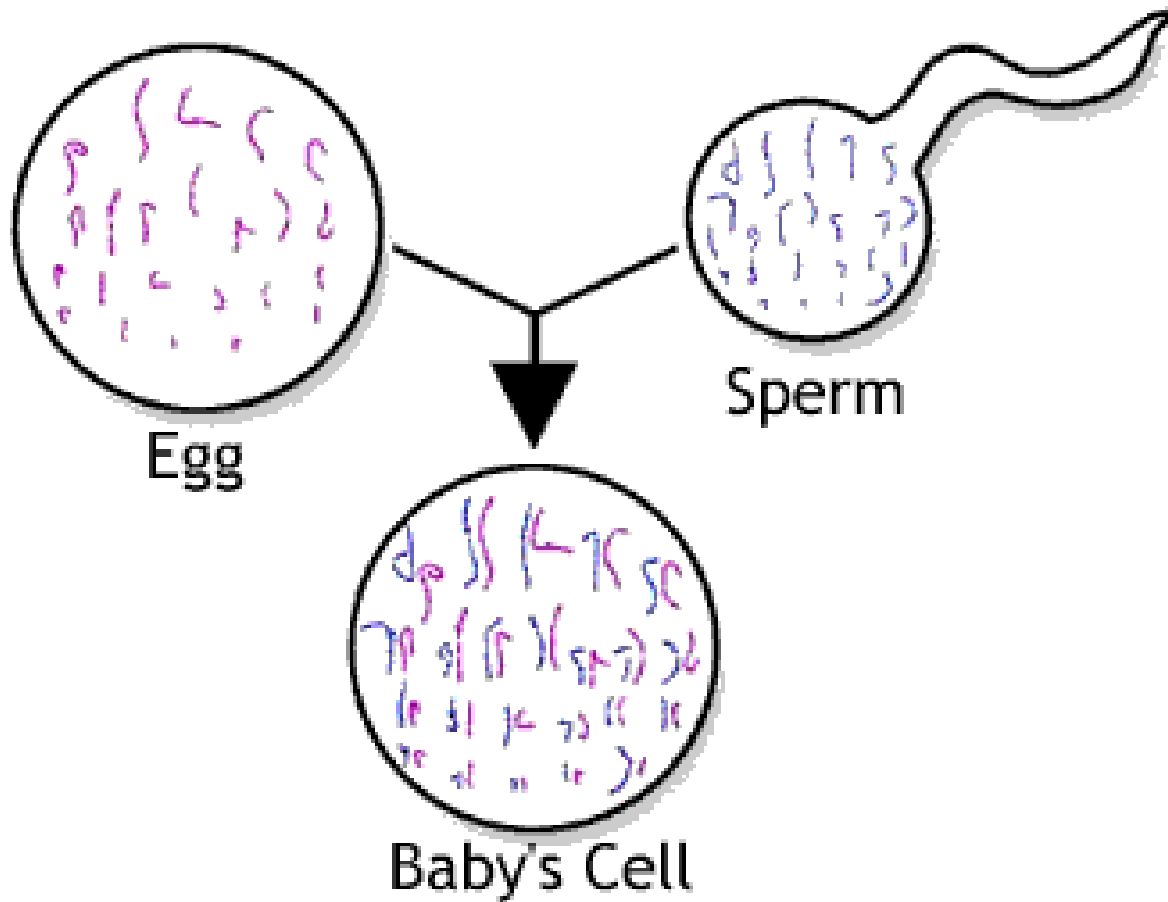

CYTOSINE ALWAYS COMBINES WITH GUANINE

ADENINE ALWAYS COMBINES WITH THYMINE

**DEOXYRIBO  
NUCLEIC  
ACID**

TRANSMITS GENETIC INFORMATION

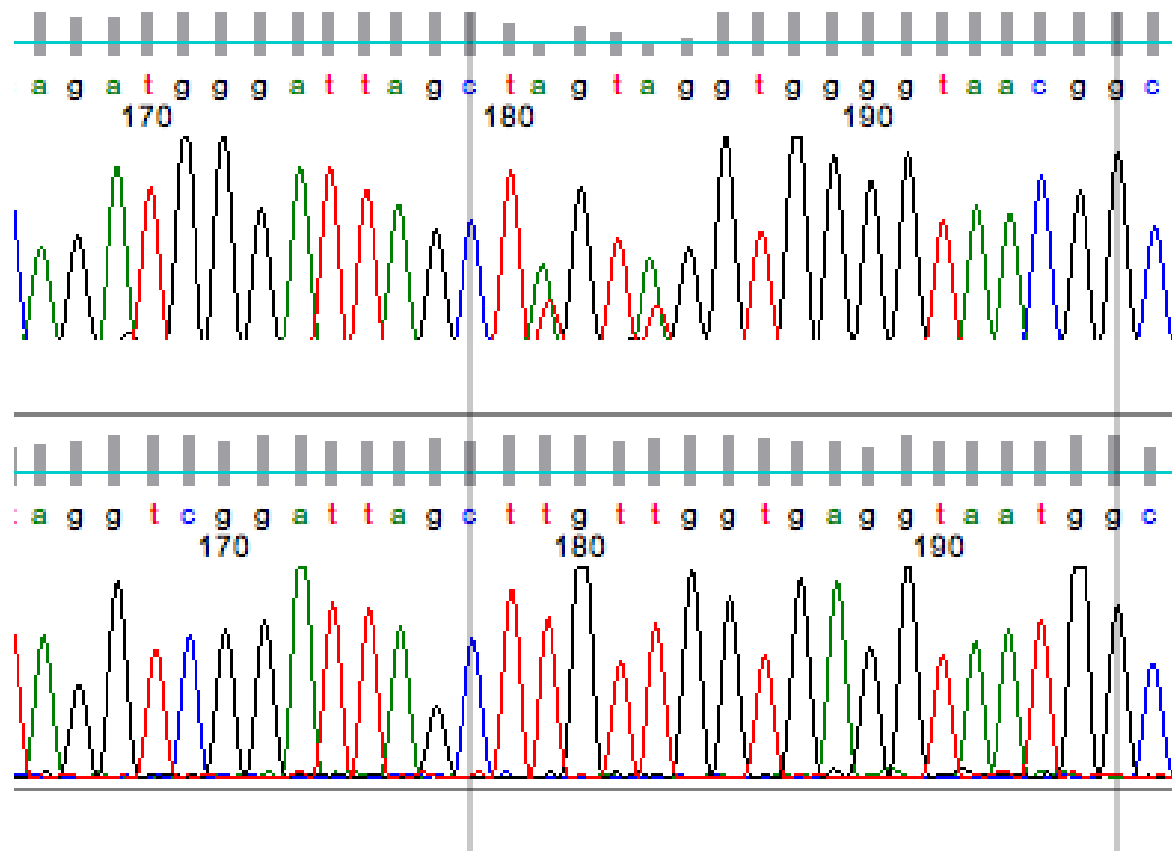

# Basic Tests

# Basic Tests

# Don't Forget "Clinical Tests"!!

Adapted from National Human Genome Research Institute

Alternative variants of genetic information at a specific locus

# Allele

Wild Type

- Normal version of the sequence
- Considered the prevailing version

Mutant

- Permanent change in the nucleotide sequence
- Disease-causing

Polymorphism

- “Many forms”
- Locus has at least two relatively common alleles

- Allele frequency  $\geq 0.01$

Rare Variant

- Rare allele that is not disease causing
- Allele frequency  $\leq 0.01$

# Name that term!

## Genotype

Set of alleles that make up a person's genetic constitution, usually at a single locus (rarely the word is used for all loci)

*FGF8*: c.653C>T, resulting in p.Thr229Met

# Name that term!

## Phenotype

Observable expression of a genotype as a trait (can be morphological, clinical, biochemical, etc.)

# Genotype

# Phenotype

- “Genotype-Phenotype” correlations
- Frequently not (yet) possible
- Some interesting exceptions

# It depends on the type of mutation

# Name that term!

*de novo*

Term for a mutation that appears in a proband (and does not appear to be present in the parents)

Single gene disorder

Determined by alleles at a single locus

Individual or Genotype

Homozygote

Heterozygote

Compound Heterozygote

An individual with the same allele in each locus

An individual with different alleles in each locus ( a wild type allele, a mutant allele)

An individual with 2 different mutant alleles of the same gene

# Heterogeneity

## Locus (Genetic) Heterogeneity

Disorders can be caused by mutations in different genes, or by different mechanisms

Examples: Retinitis Pigmentosa, Noonan syndrome,  
*MANY* more...

# Locus Heterogeneity

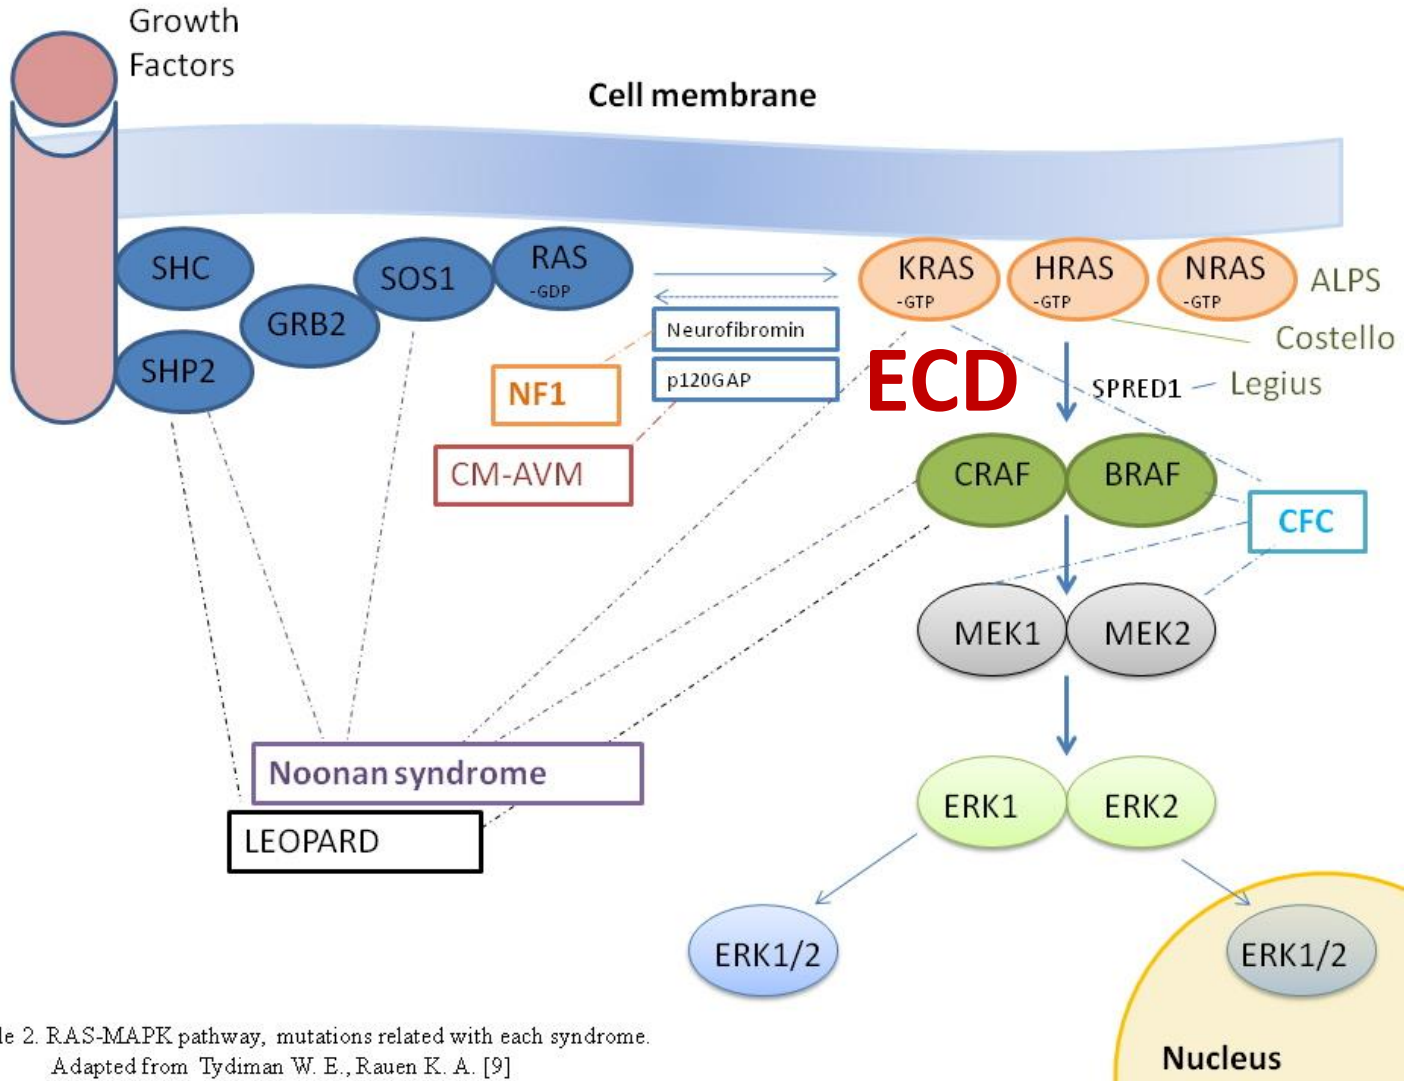

Table 2. RAS-MAPK pathway, mutations related with each syndrome.  
Adapted from Tydman W. E., Rauen K. A. [9]

# Heterogeneity

## Phenotypic Heterogeneity/ Pleiotropy

Changes in a single gene influences  
multiple phenotypic traits

Example: Holt-Oram syndrome (*TBX5*)

# Congenital vs. Genetic

- Congenital: present at birth
- Genetic: determined by genes
- A condition can be both congenital and genetic

# Miller-Dieker Syndrome

- Deletion of 17p13.3
- *LIS1*
- Severe neurological compromise, seizures, organ anomalies

# III. Inheritance Patterns

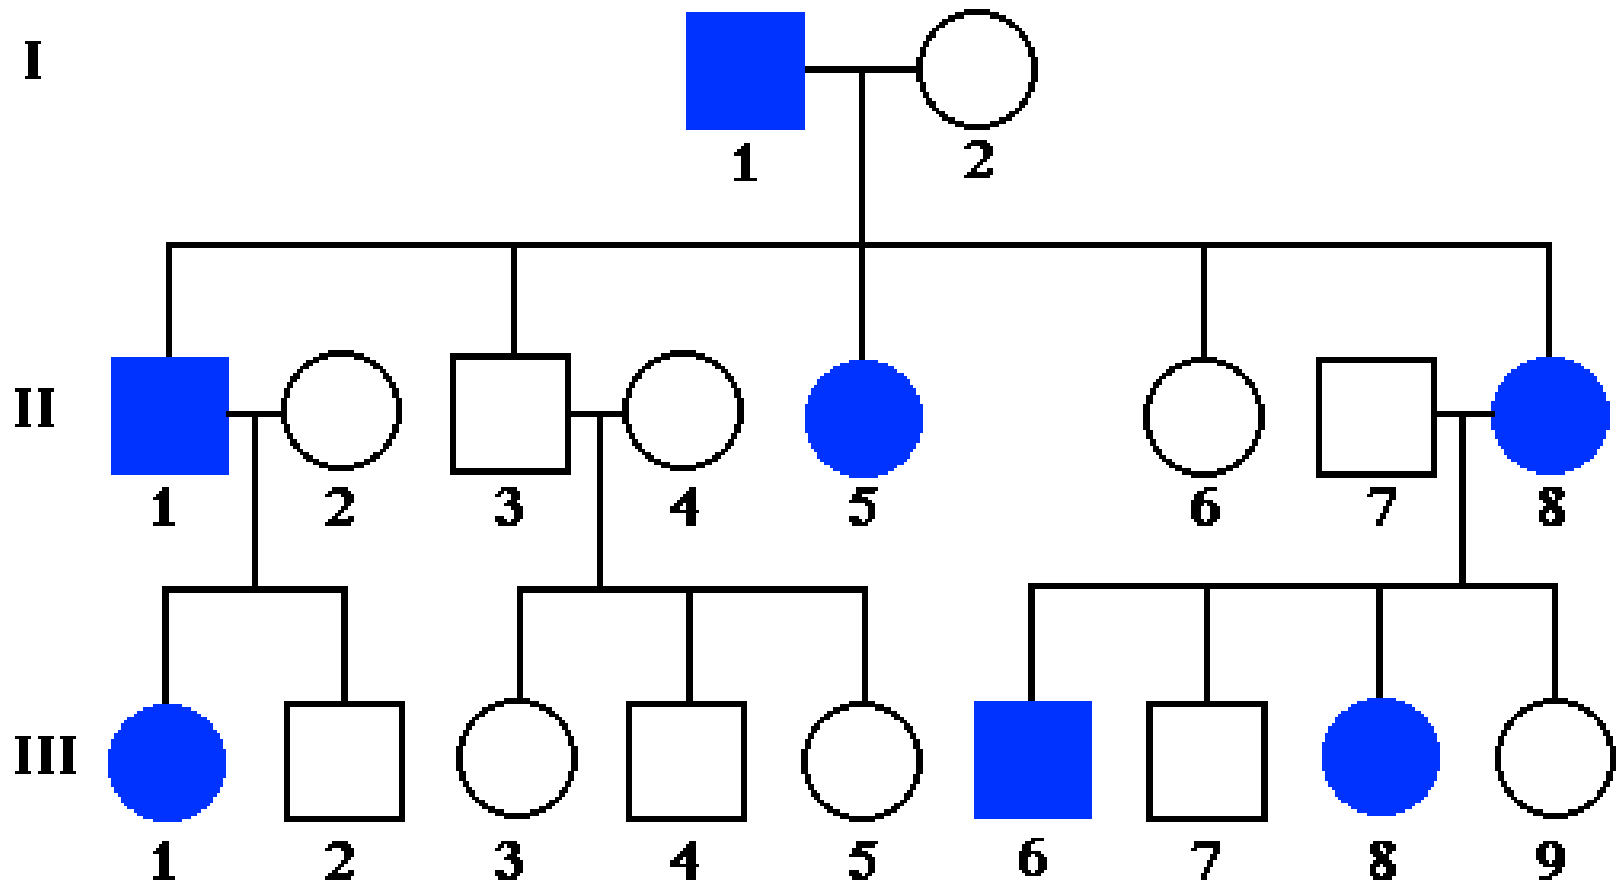

## **Goal:**

Familiarity with basic patterns of human heredity

# “Mendelian” disorders

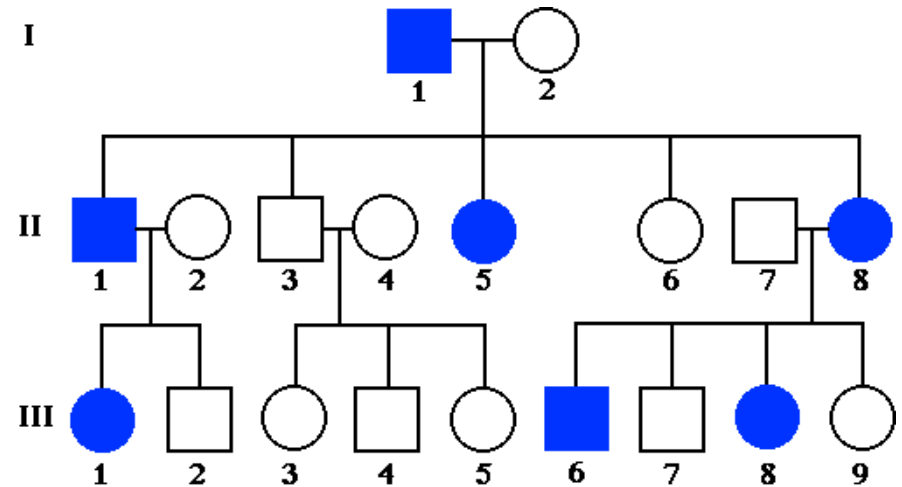

# Autosomal Dominant

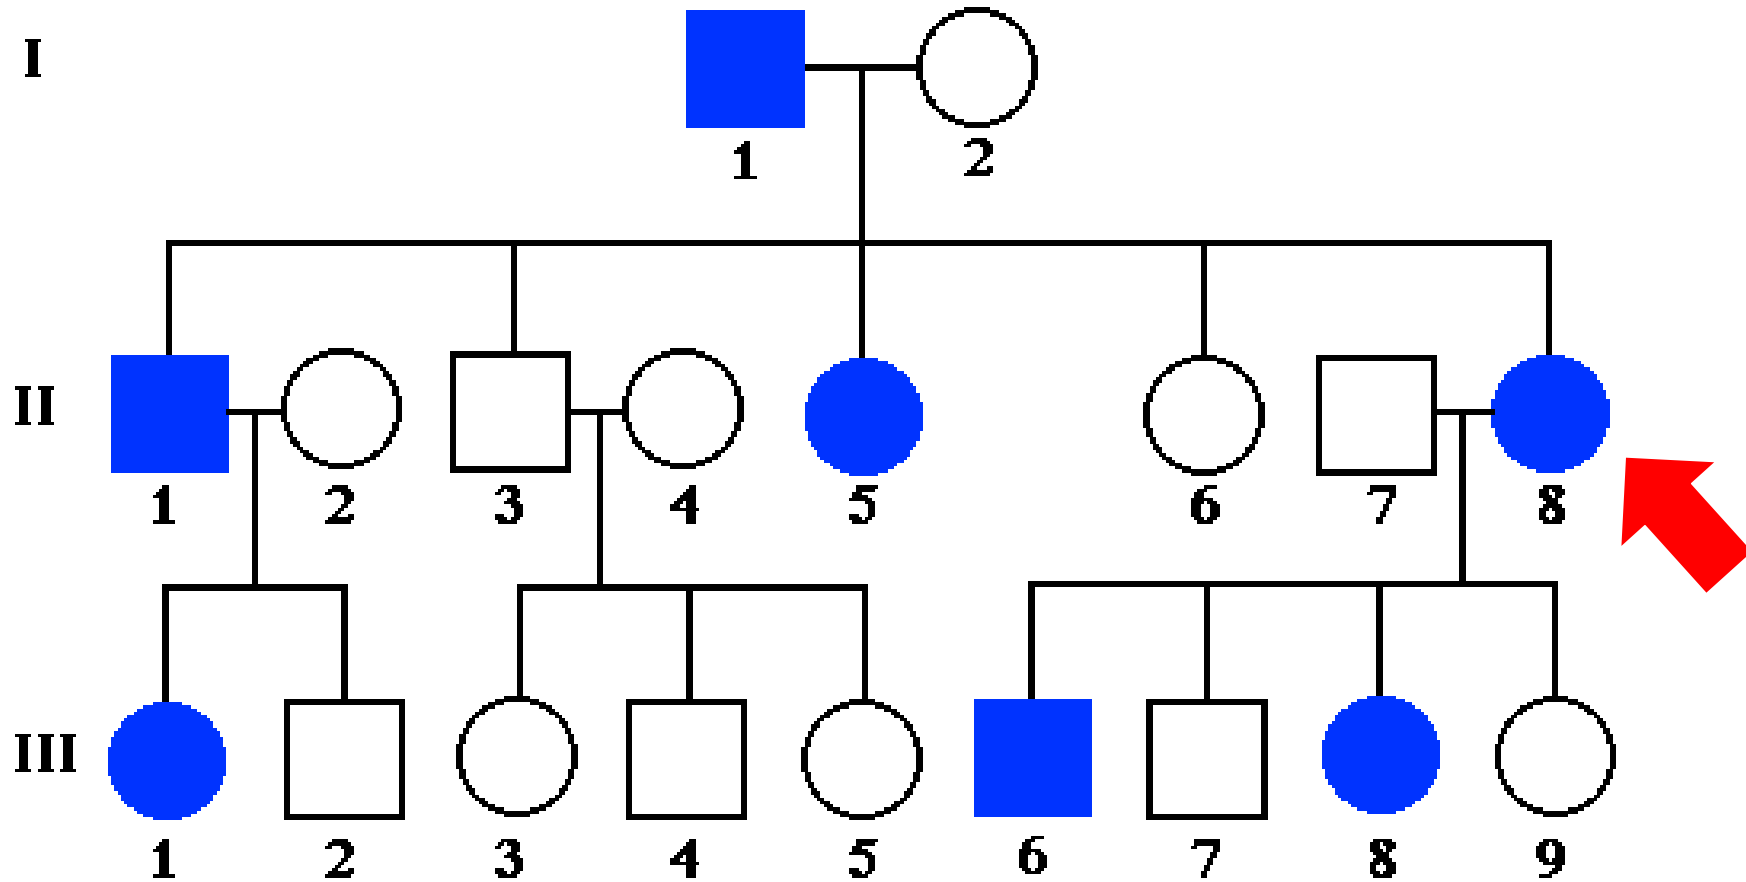

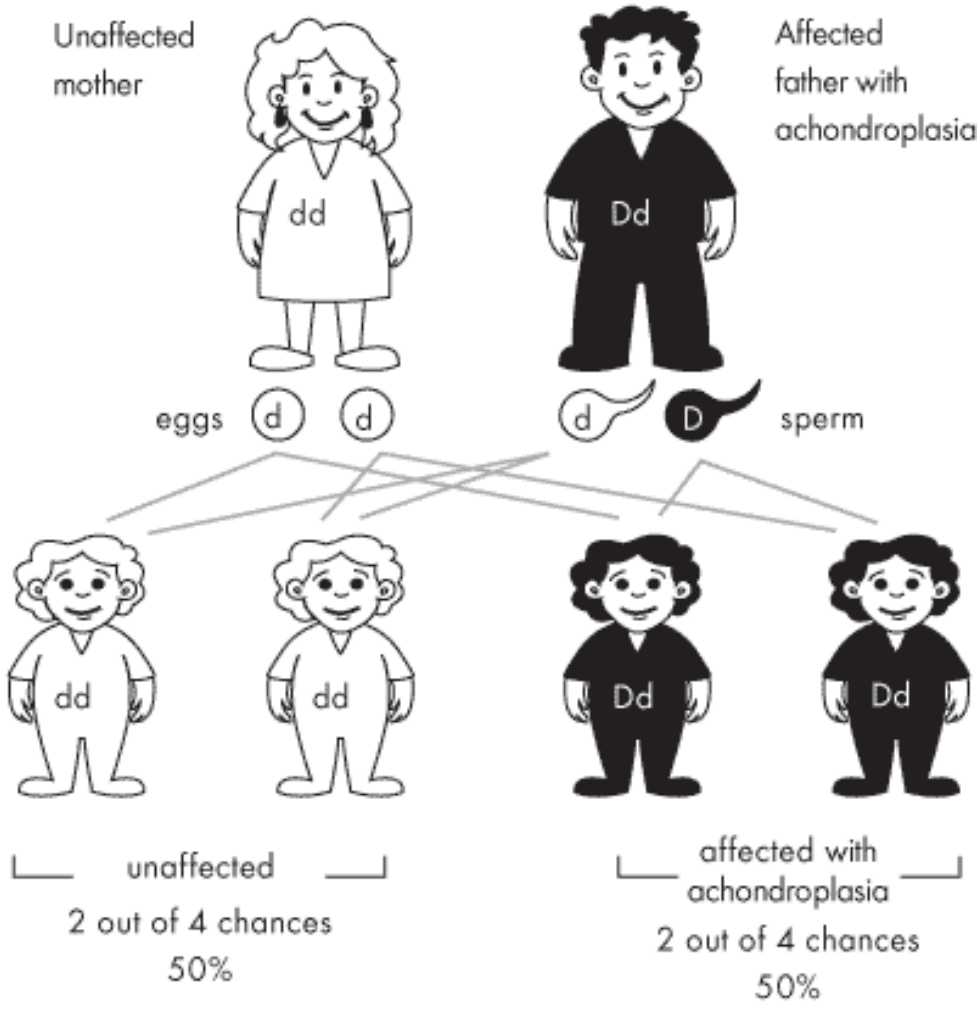

# Autosomal Dominant

- “Phenotype seen in heterozygotes”
- Males and females equally affected
- Every affected person (usually) has an affected parent
- Unaffected parents (usually) don't have affected children

# Autosomal Dominant: Recurrence Risk

# NF-1

# Tuberous Sclerosis

# Autosomal Recessive

# Autosomal Recessive

- “Phenotype only in homozygotes”
- Males and females equally affected
- Affected people have unaffected parents
- Affected people have unaffected children

# Autosomal Recessive

$Gg \times Gg$

	<b>G</b>	<b>g</b>
<b>G</b>	<b>GG</b>	<b>Gg</b>
<b>g</b>	<b>Gg</b>	<b>gg</b>

$Rr \times rr$

	<b>R</b>	<b>r</b>
<b>r</b>	<b>Rr</b>	<b>rr</b>
<b>r</b>	<b>Rr</b>	<b>rr</b>

# Autosomal Recessive

- We all are carriers of ~8-10 recessive mutations
- Certain alleles are more common in specific populations
- Usually, new mutation rate < carrier rate

*Savage Chickens*

by Doug Savage

www.savagechickens.com

# Bardet-Biedl syndrome

# Autosomal Recessive: Recurrence Risk

# Autosomal Recessive

	G	g
G	GG	Gg
g	Gg	gg

The Punnett square shows the possible genotypes from a cross between two heterozygous individuals (Gg x Gg). The top row represents the male parent (G and g) and the left column represents the female parent (G and g). The resulting genotypes are GG, Gg, Gg, and gg. The gg genotype is highlighted with a red circle and a diagonal slash, indicating it is the recessive phenotype.

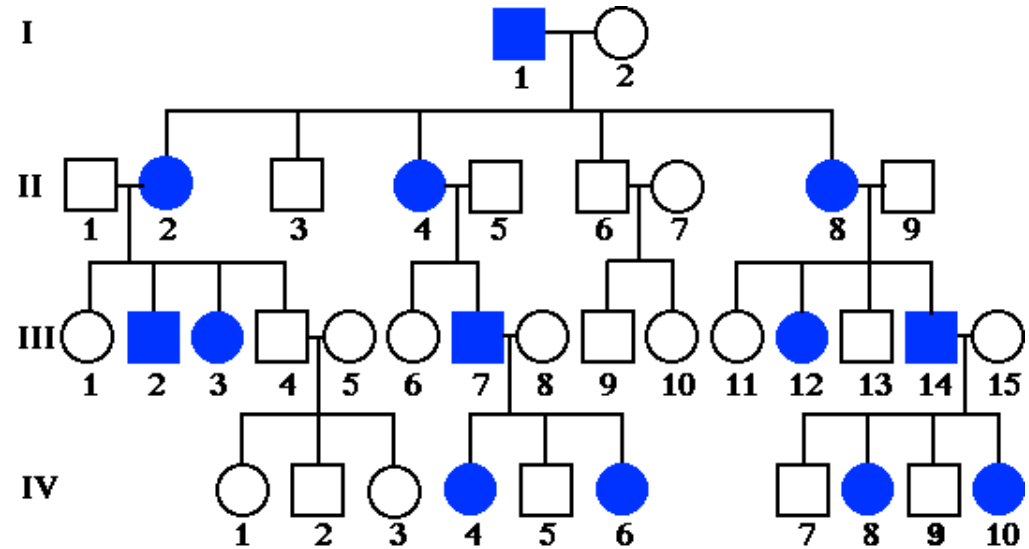

# X-linked “Recessive”

- Males predominantly affected
- Female “carriers” may show some disease signs
- Condition never transmitted from father to son
- “Carrier” female can have affected sons

# X-linked “Dominant”

- Affected males have no affected sons
- Affected males have all affected daughters
- What can it look like?
- Autosomal dominant
- Don’t forget “pseudo-autosomal” conditions

# Other Modes of Inheritance

# Mitochondrial

- ~16.5 kb DNA
- Maternal inheritance
- Incomplete penetrance
- Heteroplasmy
- Threshold effect
- Can be tissue-specific
- (Remember: some mitochondrial disorders are recessive)
- A diagnostic challenge!

# Mosaicism

- An individual or tissue with multiple genetically different cell lines derived from a single zygote
- Pre vs. postnatal
- Somatic vs. germline

# Mosaicism

# Complex/Multifactorial

Neural tube defects

Multiple Sclerosis

Hypertension

ADHD

DIABETES MELLITUS

Longevity

ASTHMA

Obesity

Schizophrenia

Kawasaki's disease

# Cancer Genetics

- **Cancer: A Genetic Disease**
- **Oncogenes**
- **Tumor Suppressor Genes**
- **Genetic Pathways to Cancer**

# Cancer Arises From DNA Mutations in Cells

Artwork by Jeanne Kelly, © 2010.

# Cancer and Genes

- Oncogenes are genes that, when mutated, actively promote cell proliferation.
- Tumor suppressor genes are genes that, when mutated, fail to repress cell division.

# Genetic Pathways to Cancer

- ▶ Most malignant tumors cannot be attributed to mutation of a single gene.
- ▶ Tumor formation, growth, and metastasis depend on the accumulation of mutations in several different genes.
- ▶ The genetic pathways to cancer are diverse and complex.

# Somatic Mutation and Cancer

- ▶ Somatic mutation is the basis for the development and progression of all types of cancer.
- ▶ As mutations accumulate and cells become unregulated, genetic instability increases the likelihood that the cells will develop the hallmarks of cancer.

# Pathways and Cancer.

Figure 2. BRAF<sup>V600E</sup> Mutation and RAS-RAF-MEK-ERK Signal Transduction Cascade

AKT: *v-akt murine viral oncogene*; Bad: *Bcl-2-associated death promoting protein*; EGF: *epidermal growth factor*; EGFR: *EGF receptor*; ERK: *extracellular signal-regulated kinase*; GSK3: *glycogen synthase kinase 3*; K-RAS: *v-Ki-ras2 Kirsten rat sarcoma viral oncogene homologue*; MEK: *MAPK/ERK kinase*; mTOR: *mammalian target of rapamycin*; NF-κB: *nuclear factor κB*; PI3K: *phosphoinositide 3-kinase*; RAF: *proto-oncogene serine/threonine kinase*; RAS: *rat sarcoma subfamily of guanine triphosphate-binding proteins (GTPases)*; She: *Src homology 2 domain*; Sos: *"Son of sevenless" guanine nucleotide exchange protein*; TK: *tyrosine kinase*.

# Cancer Targeted Therapies – FDA Approved.

- Adenocarcinoma of the stomach or gastroesophageal junction: Trastuzumab (Herceptin®)
- Basal cell carcinoma: Vismodegib (Erivedge™)
- Brain cancer: Bevacizumab (Avastin®), Everolimus (Afinitor®)
- Breast cancer: Everolimus (Afinitor®), tamoxifen, toremifene (Fareston®), Trastuzumab (Herceptin®), fulvestrant (Faslodex®), anastrozole (Arimidex®), exemestane (Aromasin®), lapatinib (Tykerb®), letrozole (Femara®), pertuzumab (Perjeta™), ado-trastuzumab emtansine (Kadcyla™)
- Colorectal cancer: Cetuximab (Erbix®), Panitumumab (Vectibix®), Bevacizumab (Avastin®), Ziv-aflibercept (Zaltrap®), Regorafenib (Stivarga®)
- Dermatofibrosarcoma protuberans: Imatinib mesylate (Gleevec®)

- Head and neck cancer: Cetuximab (Erbix<sup>®</sup>)
- Gastrointestinal stromal tumor: Imatinib mesylate (Gleevec<sup>®</sup>), Sunitinib (Sutent<sup>®</sup>), Regorafenib (Stivarga<sup>®</sup>)
- Giant cell tumor of the bone: Denosumab (Xgeva<sup>®</sup>)
- Kaposi sarcoma: Alitretinoin (Panretin<sup>®</sup>)
- Kidney cancer: Bevacizumab (Avastin<sup>®</sup>), Sorafenib (Nexavar<sup>®</sup>), Sunitinib (Sutent<sup>®</sup>), Pazopanib (Votrient<sup>®</sup>), Temsirolimus (Torisel<sup>®</sup>), Everolimus (Afinitor<sup>®</sup>), Axitinib (Inlyta<sup>®</sup>)
- Leukemia: Tretinoin (Vesanoid<sup>®</sup>), Imatinib mesylate (Gleevec<sup>®</sup>), Dasatinib (Sprycel<sup>®</sup>), Nilotinib (Tasigna<sup>®</sup>), Bosutinib (Bosulif<sup>®</sup>), Rituximab (Rituxan<sup>®</sup>), Alemtuzumab (Campath<sup>®</sup>), Ofatumumab (Arzerra<sup>®</sup>), Obinutuzumab (Gazyva<sup>™</sup>)
- Liver cancer: Sorafenib (Nexavar<sup>®</sup>)

- Soft tissue sarcoma: Pazopanib (Votrient®)
- Stomach cancer: Ramucirumab (Cyramza™)
- Systemic mastocytosis: Imatinib mesylate (Gleevec®)
- Thyroid cancer: Cabozantinib (Cometriq™), Vandetanib (Caprelsa®), Sorafenib (Nexavar®)
